The attorney, Thomas Ciccarone, said a sergeant tried to get into the band with pepper spray, and one man was stabbed by a Guardsman when the two got into a fight. The U.S. Army stopped short of taking action after a clash between guardsmen and protesters at the base on Saturday. But a Dover police officer has filed a complaint accusing an Ohio National Guard sergeant of striking a protester and then using pepper spray on others. Dover police Chief Gary Hanni confirmed the complaint was filed, but didn't name the sergeant or provide a copy of the complaint because that's still the subject of an internal investigation. A police report posted online lists the sergeant's name. The officer who filed the complaint is named, as is the state of Ohio and the Army. The Dover Police Department also alerted a state prosecutor to the situation, which is routine when police accuse someone of violating Ohio law while on duty. The clash took place on base after about 40 protesters set up on the front lawn of the base in a peaceful demonstration. A large contingent of guardsmen showed up and set up about 50 yards away. A group of about a dozen guardsmen moved toward the protesters. At one point, several protesters tried to block their approach. That's when the guardsmen started pushing and shoving. The two sides separated and the Guardsmen went back to their position. That's when the sergeant, who was with the guardsmen, walked up to the protesters and pepper sprayed several of them. The guardsmen, members of the 85th Military Police Brigade,

Miray, HDClone, Professional, 4.0.7, Portable.rar, . 3dDehydroepiandrosterone (DHEA) and dehydroepiandrosterone sulphate (DHEA-S) serum concentrations in women with arterial hypertension. Increased cardiovascular risk of women with arterial hypertension has been linked with high free androgen index (FAI) and low sex-hormone-binding globulin (SHBG) levels. Dehydroepiandrosterone (DHEA) is an important precursors of androgens and can be converted to bioactive androgens by 5 alpha-reductase. Dehydroepiandrosterone sulphate (DHEA-S) is an important substrate for sex steroid 5 alpha-reductases. We have observed significantly decreased DHEA and DHEA-S serum levels in women with arterial hypertension. We have also observed significant positive correlations between DHEA, DHEA-S and FAI, DHEA-S and SHBG in women with arterial hypertension. Dehydroepiandrosterone (DHEA) and dehydroepiandrosterone sulphate (DHEA-S) serum levels were measured by radioimmunoassay (RIA) method in 21 normotensive, 14 women with essential and 19 women with secondary hypertension. FAI was assessed by the ratio of total testosterone (T) and SHBG using RIA method. The serum concentrations of DHEA were significantly lower in women with arterial hypertension than in the normotensive ones. DHEA levels correlated with blood pressure values, heart rate, smoking, age and body mass index in the three groups. In the normotensive women, DHEA-S and FAI correlated positively with each other. DHEA-S and FAI correlated with serum insulin levels in the normotensive women. In the hypertensive women DHEA-S and SHBG correlated with each other. In the hypertensive women DHEA-S and FAI correlated positively with each other. DHEA and DHEA-S serum levels were significantly reduced in women with arterial hypertension. Decreased DHEA and DHEA-S serum levels in hypertensive women might be associated with the
